

Quick Find

Group 14 : Luka Jack Komljen, Vedran Gvozderac, Aleksandra Zečević

The Problem

Institutions, companies and some individuals rely on outdated data management systems.

Traditional file systems make it hard to find relevant information.

Who is affected

We want to help people that are overwhelmed with sources of information with no way to efficiently find what they need.

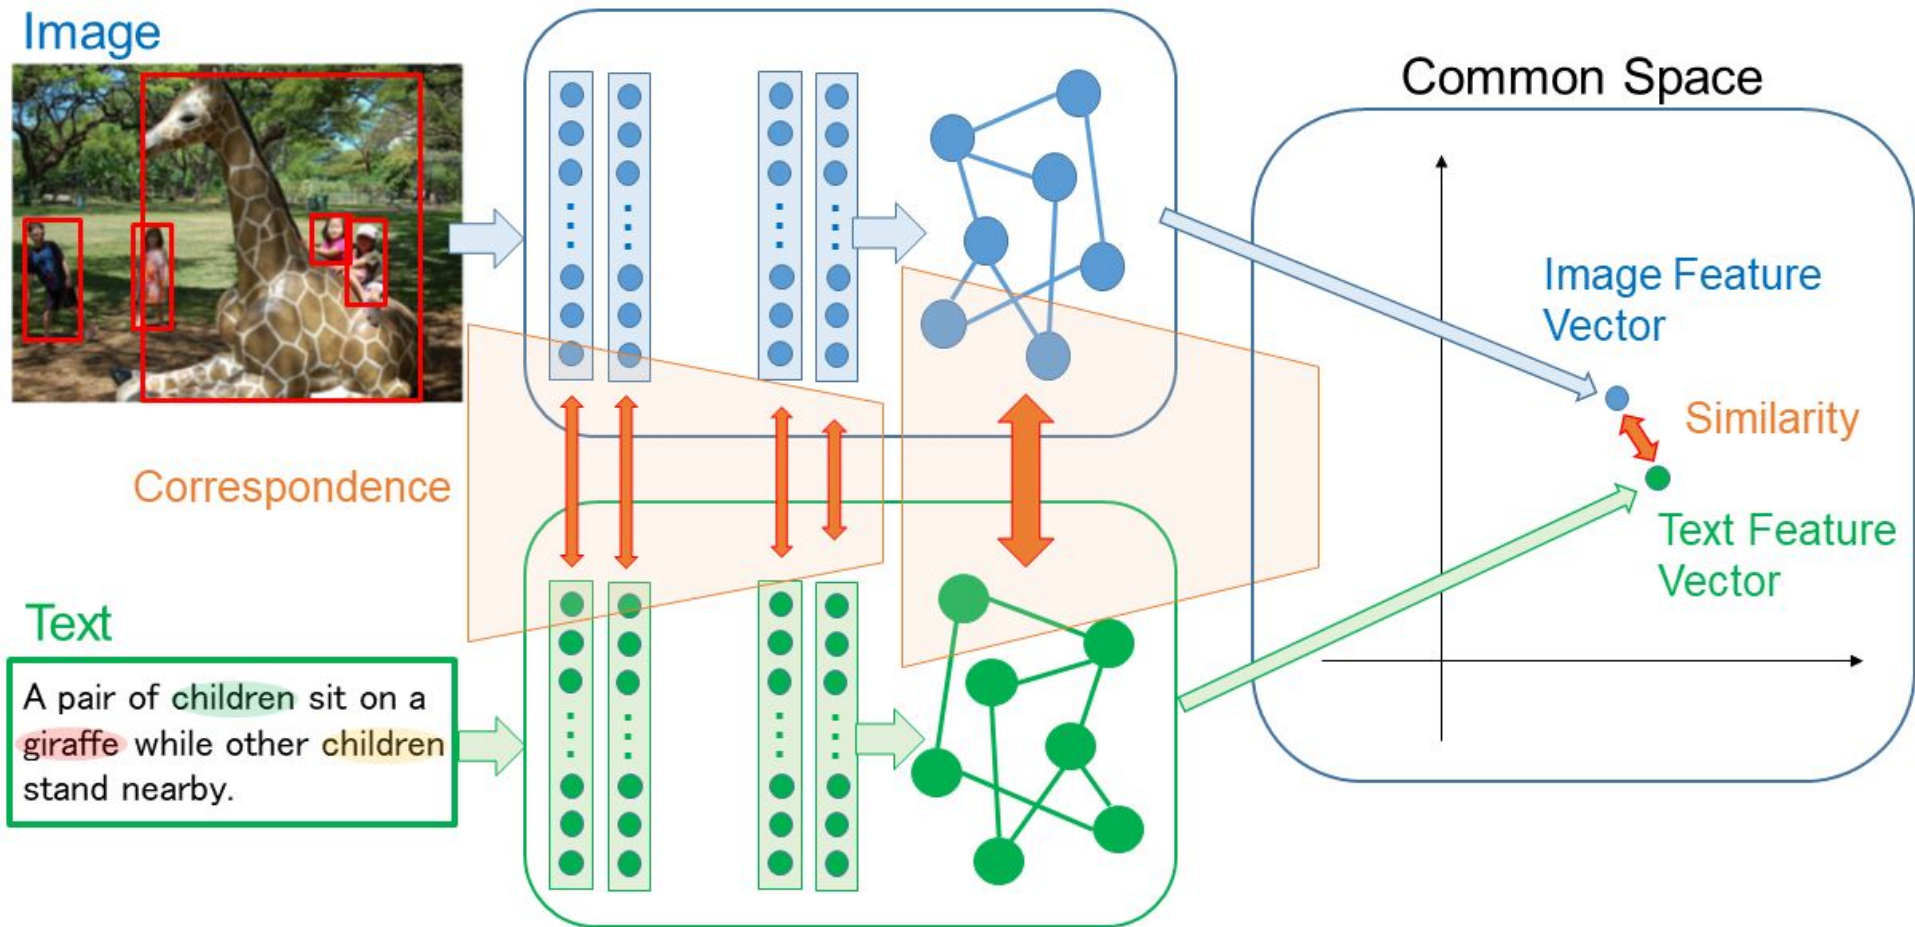

A close-up photograph of a person's hand pointing at a document with a pen. The background is blurred, showing some bokeh lights.

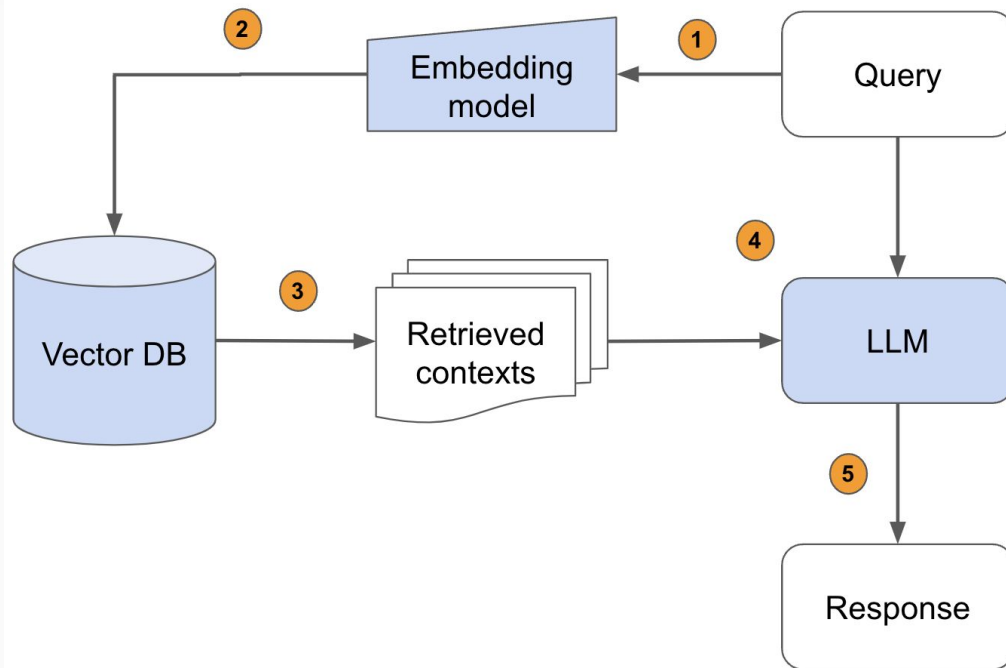

Core idea and the solution

We store files in a way that allows the system to quickly find relevant information based on the meaning of a user's question.

The system takes the most relevant retrieved documents and passes them to a Large Language Model, which uses that information to explain the data and answer the original question accurately.

How it works?

The Alternatives

Relational Databases (MySQL, PostgreSQL, Oracle)

Standard File Systems (SharePoint, Windows Explorer, Google Drive)

Legacy Filing Methods (Microsoft Access, Lotus Notes, Manual Archives)

So what did we improve?

Searches by meaning, not just filenames or exact keywords

Works across any digitized legacy format immediately.

Transparent answers with citations

No rigid schemas or complex queries required

Why It Matters

Unlocks information trapped in old files and formats.

Provides transparent answers rooted in verified sources.

Connects non-technical staff to complex government datasets.

The end

Thank you for listening!

Why someone would use our solution:

- Saves time & money
- No technical expertise required
- Works with existing data

What we're most proud of:

- Turning unusable data into knowledge
- Building a **practical, real-world AI system**
- ...Balancing innovation with trust & transparency.....
